

Properly insulating and sealing air leaks can help many homes save as much as 30 percent in winter heating costs. Home weatherization not only saves homeowners money and leaves them with a more comfortable living space, it also reduces the pollution associated with generating energy used for heating. For more ways to weatherize your home contact the Department of Natural Resources' Energy Center or visit the U.S. Department of Energy's Energy Savers Web site at www.eere.energy.gov/consumer/tips/.
